AMENDMENTS TO THE SPECIFICATION

Please replace the paragraph at page 2, line 10 with the following rewritten paragraph:

-- An object of the invention is to provide an attachment mechanism connecting the cover plate and the housing of a computer. The attachment mechanism comprises a housing, a cover plate, a fixed member, and a pivoting member. The fixed member is disposed on the cover plate. The pivoting member is pivoted on the fixed member, having a contacting portion and a lever portion connected thereto, wherein the lever portion has a protrusion integrally formed with the contacting portion, such that a part of the housing is wedged between the contacting portion and the protrusion when the cover plates are attached to the housing. The pivoting member pivots to exert a force on the housing such that the cover plate separates from the housing.
